CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

(c) Housekeeping for premises. Premises where housing facilities are located, including buildings and surrounding grounds, must be kept clean and in good repair in order to protect the nonhuman primates from injury, to facilitate the husbandry practices required in this subpart, and to reduce or eliminate breeding and living areas for rodents, pests, and vermin. Premises must be kept free of accumulations of trash, junk, waste, and discarded matter. Weeds, grass, and bushes must be controlled so as to facilitate cleaning of the premises and pest control.

The sink and backsplash area were very dirty in the orangutan area in the rain forest building. Much of this wall had large greas that needed thoroughly scrubbed. These areas need a thorough cleaning to maintain appropriate husbandry and cleaning to protect the animals from harm, especiacially since this serves as a food prep area.

3.75 (a)

3.75 (e)

HOUSING FACILITIES, GENERAL.

(a) Structure: construction. Housing facilities for nonhuman primates must be designed and constructed so that they are structurally sound for the species of nonhuman primates housed in them. They must be kept in good repair, and they must protect the animals from injury, contain the animals securely, and restrict other animals from entering.

In the primate building there was an enclosure for a geoffroy's tamarin that was secured in place with bungee cords to electrical wires on the walls. The under support was two garbage containers on wheels. This could become a disaster if dislodged or bumped wrongly and pulled from the wall. Fire, electrocution, etc. could result.

Correct by: 11/20/03

(e) Storage. Supplies of food and bedding must be stored in a manner that protects the supplies from spoilage, contamination, and vermin infestation. The supplies must be stored off the floor and away from the walls, to allow cleaning underneath and around the supplies. Food requiring refrigeration must be stored accordingly, and all food must be stored in a manner that prevents contamination and deterioration of its nutritive value. Only the food and bedding currently being used may be kept in animal areas, and when not in actual use, open food and bedding supplies must be kept in leakproof containers with tightly fitting lids to prevent spoilage and contamination. Substances that are toxic to the nonhuman primates but that are required for normal husbandry practices must not be stored in food storage and preparation areas, but may be stored in cabinets in the animal areas.

There were several areas with feed storage problems. Monkey island fridge had an uncovered bucket of blood left over from a previous feeding (it was supposed to be disposed of, not kept). There were peanuts stored totally loose in the bottom drawer and an open bag of fruit loops. There were keeper foods stored in the same area as the animal feed, pizza, chicken, etc. In the Australian area there were ice cube trays of feed and treats uncovered in the freezer.

There was also an open bag of bedding on the floor.

The bear/ tiger area had a container of pine cones(covered with peanut butter, etc) for treats that were uncovered and moldy in the fridge. In this area they were also storing cleanser and other chemicals above feed, raisins, biscuits, etc.

All feed and treats need to be kept in covered containers once opened to protect from contamination and deterioration. All waste items must be removed from feed areas. Human and animal feed should not be stored in the same areas.

CORRECTED IMMEDIATELY

3.127 (d)

FACILITIES, OUTDOOR.

INSPECTION REPORT

(d) Perimeter fence. On or after May 17, 2000, all outdoor housing facilities (i.e., facilities not entirely indoors) must be enclosed by a perimeter fence that is of sufficient height to keep animals and unauthorized persons out. Fences less than 8 feet high for potentially dangerous animals, such as, but not limited to, large felines (e.g., lions, tigers, leopards, cougars, etc.), bears, wolves, rhinoceros, and elephants, or less than 6 feet high for other animals must be approved in writing by the Administrator. The fence must be constructed so that it protects the animals in the facility by restricting animals and unauthorized persons from going through it or under it and having contact with the animals in the facility, and so that it can function as a secondary containment system for the animals in the facility. It must be of sufficient distance from the outside of the primary enclosure to prevent physical contact between animals inside the enclosure and animals or persons outside the perimeter fence. Such fences less than 3 feet in distance from the primary enclosure must be approved in writing by the Administrator. A perimeter fence is not required;

There is construction underway for a new Veterinary Clinic. The construction crew at the site are not keeping the entry gate to the area shut when not in use. It was wide open with no evidence of activity in or out when I was through the area during this inspection. To meet the perimeter fence requirement, gates must be opened the minimum amount of time necessary to accomplish the job.

Correct by: 11/14/03

3.128

SPACE REQUIREMENTS.

Enclosures shall be constructed and maintained so as to provide sufficient space to allow each animal to make normal postural and social adjustments with adequate freedom of movement. Inadequate space may be indicated by evidence of malnutrition, poor condition, debility, stress, or abnormal behavior patterns. Animal Health and Husbandry Standards

There are two sugar gliders in the Australia area that are in a cage 24" long by 18" deep by 10" high. There are no elevated resting, hiding or sleeping surfaces for the animals. There is no way for the animals to launch or even try to glide, a very normal postural adjustment,

These animals are out of the enclosures for shows regularly and do get to glide for exercise then. More is needed.

3.84 (c) REPEAT NCI

3.84 (d)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

(c) Housekeeping for premises. Premises where housing facilities are located, including buildings and surrounding grounds, must be kept clean and in good repair in order to protect the nonhuman primates from injury, to facilitate the husbandry practices required in this subpart, and to reduce or eliminate breeding and living areas for rodents, pests, and vermin. Premises must be kept free of accumulations of trash, junk, waste, and discarded matter. Weeds, grass, and bushes must be controlled so as to facilitate cleaning of the premises and pest control.

Vet Clinic - The halls especially in the veterinary clinic were extremely dirty and in need of a thorough cleaning. The kitchen floor in the feed prep and storage area needed the crack repatched and the floors resealed so that they are easy cleanable and sanitizeable.

P and C building - There were several of the metal doors in this building that were rusted and peeling. These need repaired / retreated to be readily cleaned and sanitized.

Rainforest Building - There was a large accumulation of dust and debris on the vent in the Francois monkey room. Several of the sinks and attached shelves in the animal areas were extremely dirty and needed to be cleaned. Several reffridgerators for the animals feed were also in need of a thourough cleaning.

There were some cabinets that were beginning to rust badly. These need repaired or replaced because they must be readily cleanable and sanitizeable.

The floors in this area were in need of a deep cleaning. There was major buildup of dirt in the slightly rough finish to prevent slippage. There are ways to do a better job on these kind of floors. Its time to do a thorough cleaning.

All of these areas need cleaned and sanitized regularly to maintain clean feed prep and storage areas for the animals.

REMAINS UNCORRECTED

(d) Pest control. An effective program for control of insects, external parasites affecting nonhuman primates, and birds and mammals that are pests, must be established and maintained so as to promote the health and well-being of the animals and reduce contamination by pests in animal areas.

There were several areas in the Rain Forest building showing rodent infestation by means of their feces. I saw at least one live one running through the undergrowth in the plantings. Of special concern was the pan of feed in a cupboard that had rodent feces in it. (this was removed immediately.) A continued effort must be made to keep a firm control of these pests. This is to prevent contamination of feed and bedding in the animal area by the many organisms these pests can carry.

INSPECTION REPORT

3.131 (c)

SANITATION.

(c) Housekeeping. Premises (buildings and grounds) shall be kept clean and in good repair in order to protect the animals from injury and to facilitate the prescribed husbandry practices set forth in this subpart. Accumulations of trash shall be placed in designated areas and cleared as necessary to protect the health of the animals.

Stecher barn - The wall with the sliding door has a sheet of particle board that is rotting at the bottom. This needs repaired/replaced as it makes a great entryway for rodents into the feed and bedding storage areas.

Correct by: 8/1/03

3.133

DIRECT

SEPARATION.

Animals housed in the same primary enclosure must be compatible. Animals shall not be housed near animals that interfere with their health or cause them discomfort.

There were three lions in the lion facility. The male and one female were housed together. An older female that was incompatible with the pair was kept alone. A third year intern that was trusted with the keys to the cages in this facility brought the animals in for the night and closed the divider between the two groups. The problem was that the lock was not applied. The animals worked the door open. The two younger cats attacked and the end result the male was probably the one that choked her down and asphyxiated her. That was the cause of death per the post mortem exam.

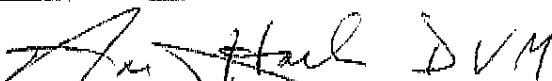

At the time of the incident there were no guidelines for the responsibilities of the interns, type of supervision and training they were to receive, who was responsible for them in areas such as this and whether it was appropriate for them to have keys.

In the case of this individual, he is a third year intern who had as much and in some ways more training than some full time keepers. The individual was disciplined and is working under the new guidelines as a first year intern. All key privileges were rescinded. This a severe break in animal care procedures that resulted in the death of an animal. Animal Care procedures are being rewritten to make each area's readily available to every individual that might be assigned to cover the area. Prior to working in a new area a keeper would be required to read and sign off on the procedures for that area.

Correct by: The intern guidelines must be online for all interns by 6/1/03

The animal care procedures should be up and running by 8/30/03

Substances that are toxic to the nonhuman primates but that are required for normal husbandry practices must not be stored in food storage and preparation areas, but may be stored in cabinets in the animal areas.

There was a large quantity of straw stored on the floor in the basement holding area. This area has a large amount of water through it. These bales could easily become wet and rotted. These must be stored off the floor to protect from contamination and prevent pest activity.
Corrected immediately.

3.84 (c)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

c) Housekeeping for premises. Premises where housing facilities are located, including buildings and surrounding grounds, must be kept clean and in good repair in order to protect the nonhuman primates from injury, to facilitate the husbandry practices required in this subpart, and to reduce or eliminate breeding and living areas for rodents, pests, and vermin. Premises must be kept free of accumulations of trash, junk, waste, and discarded matter. Weeds, grass, and bushes must be controlled so as to facilitate cleaning of the premises and pest control

Primate and cat building - There were vents in the one off holding area that needed a thorough cleaning. There was a large amount of accumulated dirt and dust on the vents. These must be maintained clean to improve the air quality in the animal area.

Corrected immediately
Rainforest building - animal care areas - The stainless steel sinks and attached shelves in these areas were extremely dirty these need cleaned thoroughly and sanitized regularly to maintain clean work areas for feed prep and animal care activities to protect the animals from exposure to disease and contamination.
Corrected immediately

INSPECTION REPORT

Storage area in the rear of the Rainforest building - This area had large amounts of stored items on the floor and incredible amounts of clutter and dirt throughout. This area must be cleaned and organized to improve pest control and husbandry for the animals. It must be maintained in clean and organized condition for the protection of the animals from pests and other problems that this kind of clutter can create.

Correct by: 12/15/02

**3.131 (c) REPEAT NCI
SANITATION.**

(c) Housekeeping. Premises (buildings and grounds) shall be kept clean and in good repair in order to protect the animals from injury and to facilitate the prescribed husbandry practices set forth in this subpart. Accumulations of trash shall be placed in designated areas and cleared as necessary to protect the health of the animals.

The areas previously cited are corrected.

The fan vents in the bear area are extremely dirty. These must be maintained clean to provide clean air movement for the animals.

These were corrected immediately

Elephant building, pigmy hippo area - The concrete floor is peeling badly in this area leaving standing water that creates breeding areas for insects and disease organisms. The walls are also deteriorating and in need of repair to assist the caretakers in cleaning and maintaining this area for the animals. This building needs thoroughly evaluated and a plan for regular maintenance of these areas initiated and followed. This is an older building which requires more attention to maintenance.

HOUSING FACILITIES, GENERAL.**

(2) Maintenance and replacement of surfaces. All surfaces must be maintained on a regular basis. Surfaces of housing facilities -- including houses, dens, and other furniture-type fixtures and objects within the facility -- that cannot be readily cleaned and sanitized, must be replaced when worn or soiled.

There was paint peeling from the wall in the one tamarin cage in the rain forest. This could be eaten by the animals and needs removed/ replaced to protect the animals.

In the basement of the primata/cat building there was untreated wood on a kitchen counter and other wood surfaces. These need treated to be readily cleanable to prevent bacterial buildup on surfaces.

Correct by: 6/30/02

**3.101 (a) (2)
FACILITIES, GENERAL.**

(3) All surfaces in a primary enclosure must be constructed of durable, nontoxic materials that facilitate cleaning, and disinfection as appropriate, sufficient to maintain water quality parameters as designated in §3.106. All surfaces must be maintained in good repair as part of a regular, ongoing maintenance program. All facilities must implement a written protocol on cleaning so that surfaces do not constitute a health hazard to animals.

There was a wood gate in the one pool area with untreated wood. This needs treated or replaced to be impervious to moisture. There were wooden hurdles used to move the animals. These were deteriorating and need repaired/ replaced.

Correct by: 6/30/02

**3.131 (c) REPEAT NCI

The Stueker barn has cracks in the floor that are widening and need patched/repared to be readily cleanable to protect the animals. There is a wall in the storage area of this barn that is rotting with large areas deteriorating and missing. This needs repaired /replaced to prevent contamination of stored items by pests ,etc.

The bear area has some cracks in the floor that are more than an inch wide. There are gouges in the concrete walls. These need patched/repared to facilitate cleaning in these areas. This area also had a light missing its cover. This is an electrical hazard with the use of hoses for cleaning.

Elizabeth Goldentyer
USDA, APHIS
Regional Director – Animal Care
Eastern Region

Dear Ms. Goldentyer,

Our USDA APHIS inspection of 26 June 2001 identified the following non-compliant item:

3900 Wildlife Way
Cleveland, Ohio 44109
(216) 661-6500
FAX (216) 661-3312
TTY (216) 661-1090

Section -- 2.30 -- Registration as a Research Facility -- This facility is conducting studies and collecting samples that constitute research activity. One freezer has been designated to contain such samples and tissues collected from the animals. A registration packet was left with the facility.

Board of Park Commissioners
John K. O'Toole
Fred Rzepka
David W. Whitehead

All biological samples that we collect are either taken opportunistically (i.e., collected during routine or post-mortem exams) or taken specifically to enhance the health and/or monitor the reproductive status of the animals in our collection. Because of these factors, we feel that our zoo should not have to be registered as a research facility.

Executive Director-Secretary
Vern Hartenburg

Zoo Director
Steve Taylor

Sincerely,

Steve H. Taylor
Zoo Director

Date: 6/26/01

Title: Animal Care Manager

CATEGORY III: Non-compliant item(s) identified this inspection: Continued

- Section - 3.75(e), 3.125(c) - Feed and bedding Storage - There were multiple areas where feed and bedding were inappropriately stored. These included: Monkey Island - There was bedding on the floor and an open bag of bedding in this area, Wallaby treats were uncovered in icube trays in the freezer, Gray Kangaroo Building there were 2 open bags of bedding, In the Rain Forest there was an open bag of bedding on the floor, there were two more in a puddle, Bear -Cats Area - the freezer contained uncovered tubs of treats for the sun bear and the refrigerator contained uncovered bones. These and any other items that are open and uncovered must be maintained in covered containers, stored off the floor.

To be corrected by: This was corrected immediately

- Section - 3.84(c), 3.131(c) - Housekeeping - There were two vents in the cat and primate building that needed to be repaired/ replaced. One was severely damaged, the other was badly rusted with sharp edges.

The maintenance area in the Rain Forest was overflowing all over into the animal area. The area floors were black and tracking into the animal hallways. These items need corrected to provide adequate husbandry and care for the animals.

To be corrected by: 7/30/01

- Section - 3.84(d), 3.131(d) - Pest control - There were several areas of the zoo with excessive pest problems: The Rain Forest had live mice and multiple cockroaches in view., There was bird damage to the insulation and an abundance of bird feces on the stalls and animal areas in the giraffe - zebra building. In the bear area there were rodent feces in the feed storage area.

To be corrected by: 7/30/01

Polar
not

- Section - 3.131(a) - Cleaning - There was an excessive buildup of feces in the exercise area for the docent animal area. This area needs a thorough cleaning to provide for the well-being of the animals.

To be corrected by: 6/28/01
